

# Enhancing your white wine

Suggested by a DeFalco Employee

**This** is a very simple way to enhance a standard white wine concentrate with a few available ingredients.

## Ingredients:

1 4wk White Wine Kit  
100g Banana Powder  
30g Dried Elderflowers

## Instructions

1. Prepare the wine kit according to the manufacturer's recommendations. Mix the banana powder and dried elderflowers in with the concentrate as it is being added to the primary fermentor.

2. During the fermentation, the elderflowers will be forced to the surface. Once a day, gently stir the surface to keep the ingredients moist.
3. Once the specific gravity reaches 1.005 or below, transfer the wine into the carboy leaving the elderflowers and sediment behind.
4. Continue as per the manufacturer's instructions.

The addition of banana powder gives the wine a noticeable increase of mouth feel (or body) while the elderflowers increase the bouquet. The wine will be drinkable at bottling time but the full potential will be realized after 2 to 6 months in the bottle.

This modification can be adapted to any white wine concentrate with great results.

**Cheers!**
